Getting Started

This section will describe 2 methods by which you can use this product.

GitHub

The first option is to access your product via GitHub.

1. Select a folder on your Ubuntu machine that you would like to keep the product in.
2. Open a terminal, navigate to the folder you selected and **run 'sudo -s'**
3. Now **run ssh-keygen -t ed25519 -C "your_email@example.com"** using the email attached to your GitHub account.
4. Use **cat id_ed25519.pub** to show your SSH key.
5. Sign into your GitHub account online and navigate to 'Settings', and then 'SSH and GPG kays'
6. There should be a green button there that says **'New SSH Key',** Select it and enter the key you got from step **4.**

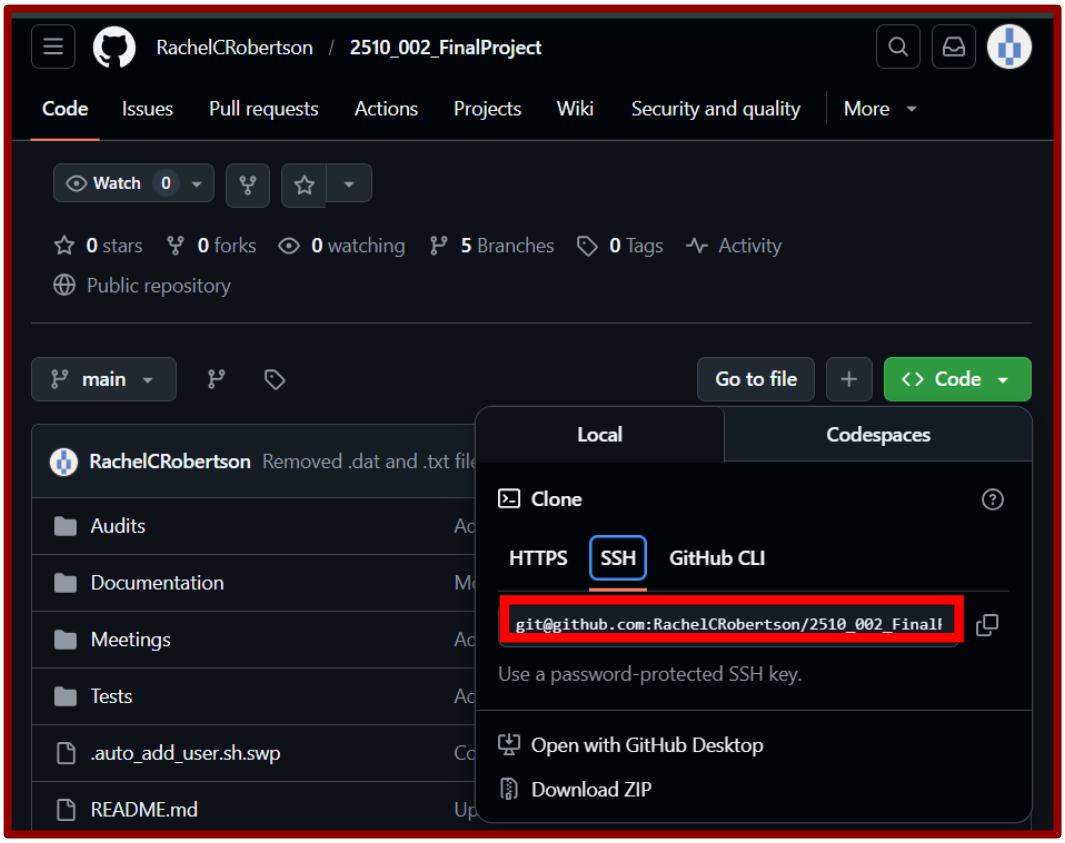
for adding an SSH key

7. Go to the remote **repository** using the GitHub link **provided to you via email**.
8. Click on the green **code button** and select the **SSH key** option.



9. **Copy the SSH key** (highlighted in red) and run the following command; **git clone theSSHKeyFromGitHub**
10. You should now have access to the repository through your Ubuntu machine.

Source Code

If you prefer to use the source code submitted via iLearn then simply;

- **Download** the file
- **Extract** the files
- Open a **terminal** where main is in the files

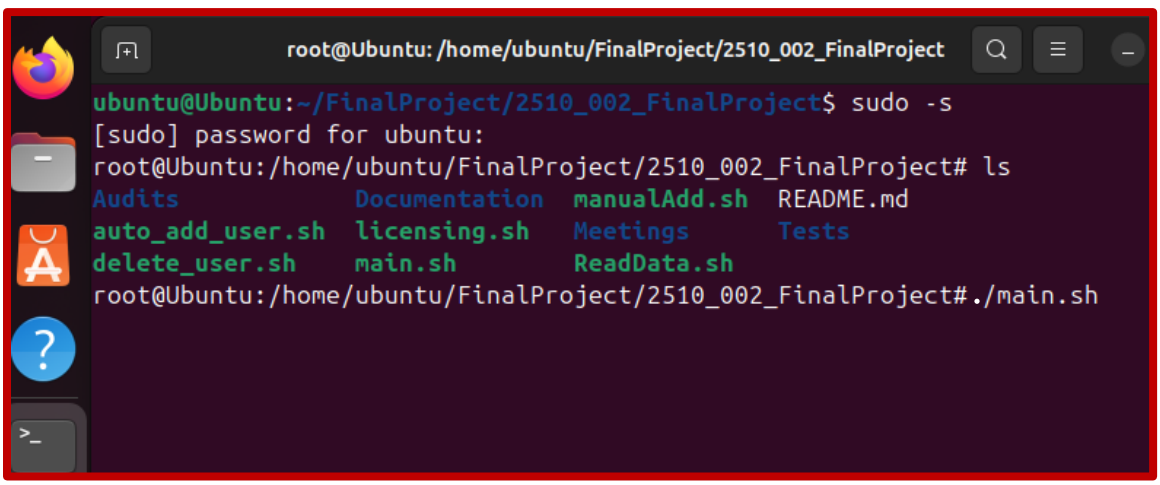
Running the Program

You should now have access to your product and can proceed to run the application.

1. To begin please enter the command **sudo -s** and enter your account password. This is **essential** because the program will require the creation of multiple files.

2. To run the program use the command **./main.sh** in the directory that holds your scripts.

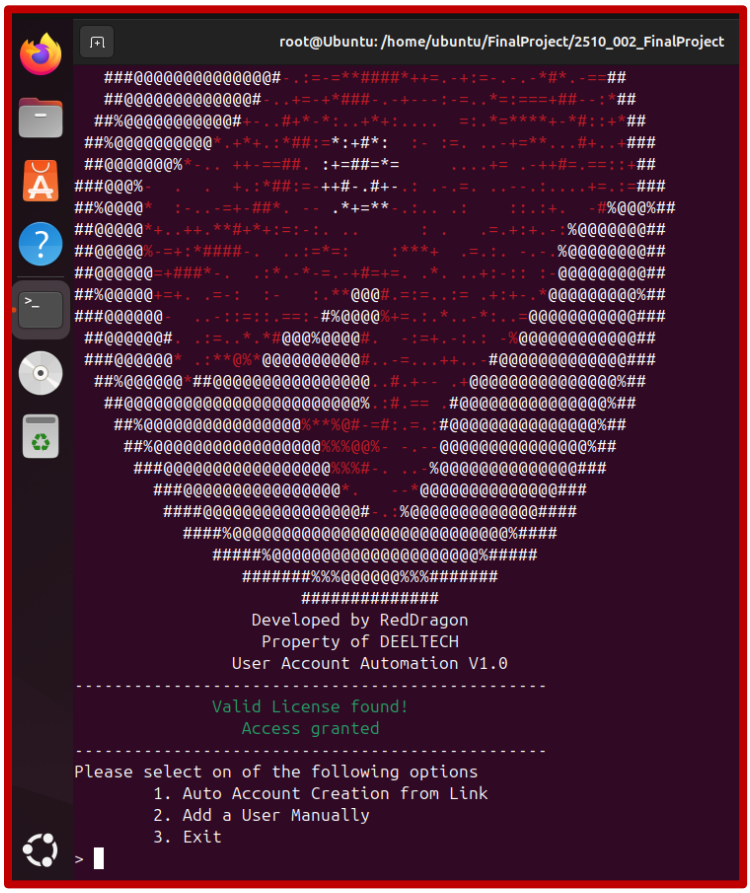
   Note: If you are unsure whether you are in the correct directory try running **ls**, your directory should appear as seen below.



Steps 1, 2

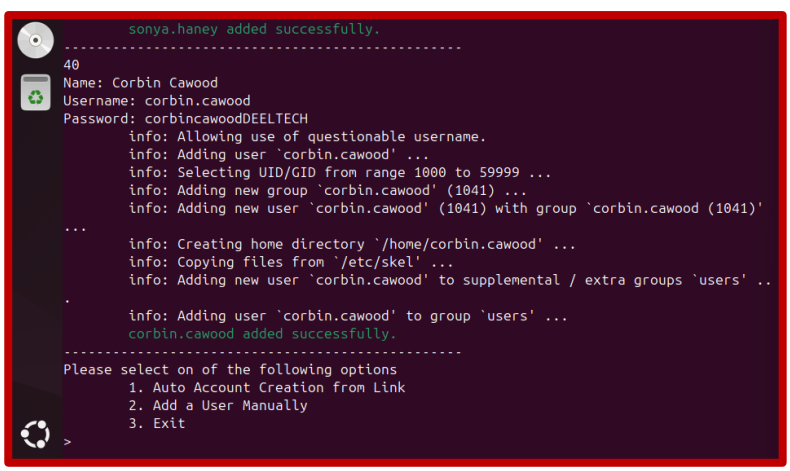
3. The program will **prompt** you for the **16-digit pin** that you have been sent. **Enter the pin** to continue.

4. You should see a menu with the following options:
   1. Add users with the auto feature
   2. Add an account manually
   3. Exit program



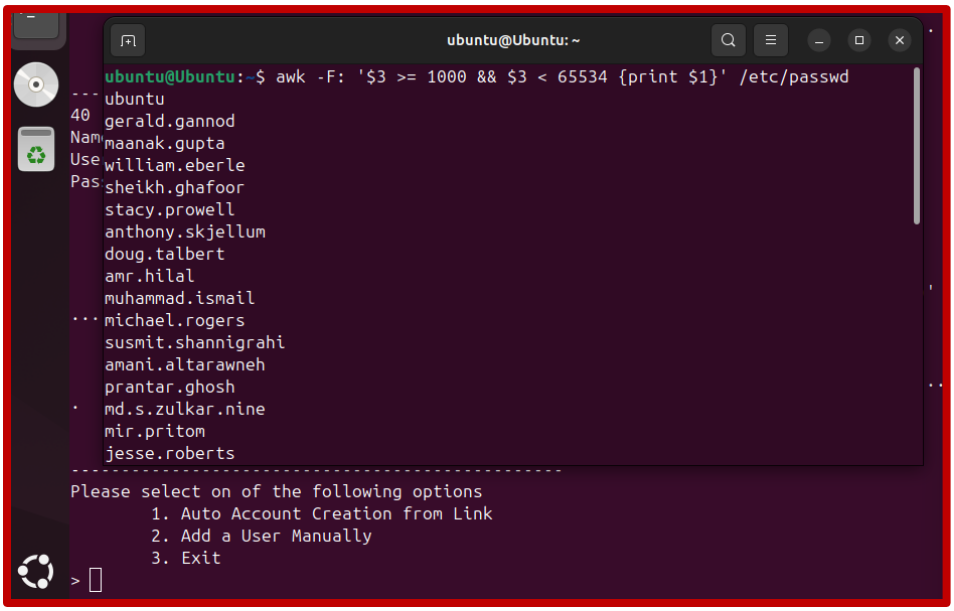
Steps 3, 4

5. If you select **option 1**, the application will **automatically create an account** for each staff member listed on the website. Corresponding output will be provided to confirm **that each staff member account was added**.



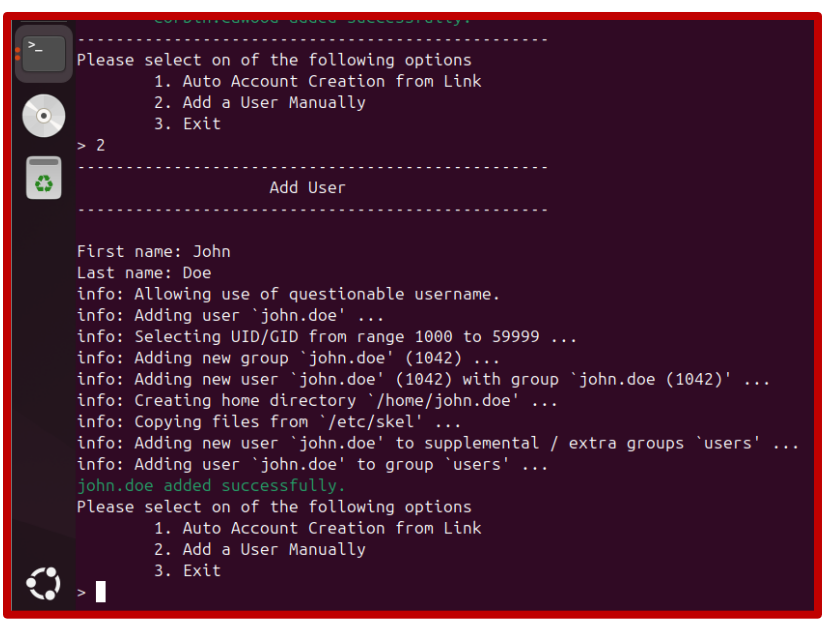
Step 5

6. To check that all the accounts were added you can open a new terminal and run **awk -F: '$3 >= 1000 && $3 < 65534 {print $1}' /etc/passwd.** This will show you all the accounts on the system.



Step 6

7. **Option 2** allows you to enter a **new user manually**.
   a. You will be prompted for a **first name** and **last name**. The account will then be created.



8. **Option 3** ends the program.

This concludes the user manual. If there are any further questions regarding the functionality of the product, please contact Rachel Robertson at rcrobertso42@tntech.edu.
