RedDragon
CSC 2510 002 Final Project
Meeting 3
Contributors: Rachel Robertson, Mallory Flesher, Zach Seitner
4–20-26

Objectives:

- Go over Auditing
- Go over testing
- Layout plan for pushing changes
    - change window
- Discuss planned changes (Due **April 28th**)
    - Show user
    - del user
    - doc update
    - conventions
    - appearance
    - licensing bug
    - Other
- Sneak peek at next presentation requirements
- Goodwill Planning
- Celebrate current success!

Auditing:

- Findings
  - fix | auto_add_user.sh line 72 "$username added successfully messages to
    - check if user is created or already created to print message
    - fix | User_Manual send updated version to client
    - fix | licensing.sh remove duplicated message line 42-45 "Valid License found! Access granted" **-need to decide where to have success message**
    - update | Master_Document to reflect changes made in auto_add_user.sh and delete_user.sh
    - update | Master Document to reflect new features added update | main.sh just make it prettier
    - add | make all documentation into .md files test | make sure new features work with main.sh (show_all_users.sh -completed AND manual_delete_users.sh -completed)
    - merge | test_main branch with main during pre-approved time given by client -pending answer on Tuesday
  - Proposed solutions

Testing:

- Findings
- Proposed Solutions

Running on prod:

- Cannot push directly to main without **giving the client notice and hearing back**
- Must have your code **checked and tested** before pushing to main (This will generate a test report)
- Must **test code once it is in production** (Only generates a report if there are findings)

- Report if the push causes any part of the program to stop working. This counts as **prod being down**. (This generates an Audit of the event that will later be emailed to the client as an explanation)
- **Download current main** before pushing.
- **Rollback procedure** if a push causes prod to go down:
    - **git revert HEAD~1**
    - **git push origin main**

Current Situation:

- Change windows will be provided **tomorrow**
- The client has been promised the following things:

  New Features:

    - Show Users COMPLETE
    - Delete User COMPLETE

  Updates:

    - Updated user manual
    - Standardized naming conventions COMPLETE (probably)
    - Modifications to licensing to prevent multiple authentications when entering the correct key

Using test_main:

- test_main is the safe version of main, **push changes** to it as **freely** as you pushed changes before we released the product.
- test_main is also the **final testing ground** before we **rebase** and merge with main.

Naming conventions:

- Filenames will follow **Lower case snake case**
- Function names will follow **Lower case snake case**
- Variable names will follow **Camel case**

Note: All files and scripts that currently exist must be **retroactively modified** to fit the above conventions.

Goodwill Planning:

- Acquire a **red undershirt** and a **black suit jacket** (and black suit pants if possible)
- Time

YOU OTTER KNOW
YOU'RE AMAZING

SUCCESS

WHEN YOU FINALLY FINISH A TASK
YOU'VE BEEN PUTTING OFF

success

stonks

GIT 'ER DONE!
